

To whom it may concern,

I've had the pleasure of working on various projects with Morgan over the last 3 years. He first approached me asking for mentorship in learning how to code and asking for help building his first piece of software, an A.I. project. As a technical founder, I get questions like these all the time and usually just give some pointers. Most often people begin the process, realize how much they don't know and either give up or simply ask me to solve their problems for them. I was surprised to hear back from him within the week. Instead of questions, he had a full working prototype of an intricate deep learning system that followed the same engineering principles that large A.I. companies like OpenAI and Google use.

Software Engineering and Data Science take raw intelligence and problem solving abilities and learning how to code takes effort. To be able to grapple with a new way of thinking while also putting together a complex and novel piece of software shows the immense benefit that Morgan adds to any team he is a part of. Watching him work is a sight to behold. There are many people with goals, but few with the grit and determination to follow through and even fewer have the intelligence and discipline to make things happen. He's got the mindset of a Navy SEAL and won't stop until the task is done.

To sum up Morgan's character I would say he's intelligent, disciplined, and relentless. If he agrees to build anything for you, he'll get it done.
